

# Build a JavaScript application

## Requirements

Build an application that shows the target indicator

- Required design below:

- The application content should be centered on a web page vertically and horizontally
- Get the initial value (\$14) from [this URL](#) using AJAX
- Animation Rules:
  - onLoad, indicator bar grows from position 0 to the initial value
  - Increase the value by \$0.2 every 2 seconds
  - Once the value reaches the target, change the background of the [Target \$15] square from gray (as on screenshot) to green (#00A910) and hide "You need..." text
- The application **must** be using jQuery.

## Packaging

Please send us a **GitHub url** or a **zip file** that contains your application. Common JavaScript frameworks should be installed via bower. I.e., expected installation process may look like this:

- unzip myapp.zip && cd myapp
- bower install

## Bonus points

- AJAX error handling on a client
- Mobile browsers support
